SAUCEDEMO | QA PORTFOLIO REPORT

Niko Naseri | Independent self-directed testing | 09 Nov 2026

A focused manual QA case study on a public e-commerce demonstration application. This is portfolio practice, not paid client testing or a claim of production QA experience.

Scope and environment

System: saucedemo.com (Swag Labs). Desktop browser: Chrome. Mobile visual review: Chrome DevTools, iPhone 14 Pro preset, 393 x 852 viewport. Test areas: login, product sorting, cart, checkout, input validation and visible mobile layout.

Execution summary

Scope	Executed	Result
Manual functional and negative tests	9	9 PASS
Mobile layout screenshots reviewed	3	3 VISUAL PASS
Confirmed application defects	-	0 in tested scope
Product-content observation	1	Review recommended
Intermittent auth/session behavior	Multiple observations	Inconclusive

Key evidence-backed outcomes

• Login: empty username correctly blocked; valid demo login opened inventory.

• Cart: item added and visible with quantity 1; removal left cart empty.

• Sorting: six product prices observed ascending (USD 7.99, 9.99, 15.99, 15.99, 29.99, 49.99).

• Checkout: a repeat run reached the order confirmation page; subtotal 9.99 + displayed tax 0.80 = total 10.79.

• Negative validation: first name, last name and postal code omissions produced the respective required-field errors.

• Mobile visual: product, cart and checkout content and core buttons were visible without obvious clipping at 393 px; denser layout was treated as normal responsive design.

Findings and interpretation

UX-001 (content consistency; review recommended). The listing and details page call the red item a “T-Shirt” while the product image appears to show a long-sleeved sweatshirt-style garment. Verify catalog intent before deciding whether to update the title, description or image. This is not a confirmed code defect.

Authentication/session observation (inconclusive). The tester encountered redirects to login while opening a product page and finishing checkout in separate sessions; other runs succeeded, including 3–4 minutes of active navigation. Idle checks remained authenticated at about 5–10 minutes and were logged out when checked after about 20 minutes. No verified timeout specification or reproduction pattern; no root cause or severity assigned.

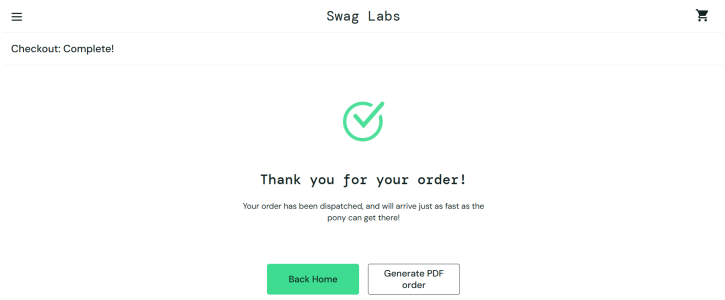

Limitations

Manual exploratory execution only; no physical smartphone test, Safari verification, performance benchmark, accessibility audit or automated regression. Screenshot review verifies rendered visibility, not tap accuracy or all screen sizes.

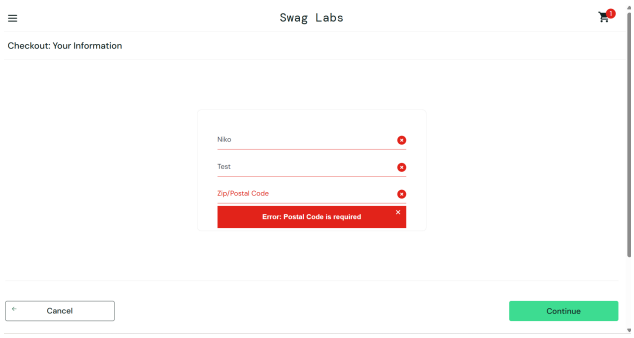

SELECTED SCREENSHOT EVIDENCE

A small sample of the full evidence folder included in the portfolio package.

Successful checkout completion

Required postal code validation

Product content consistency finding

Responsive cart layout (Chrome DevTools emulation)
